

Integrate with the Most Comprehensive Dark Web-Exposed Credential Collection in the Industry

Looking to build or enhance your product offering with the most extensive collection of exposed data that is being traded on the dark web? SpyCloud is the industry leader at discovering exposed credentials in the underground. We aren't just a cyber security company; we are a data company with the most comprehensive and accurate dark web monitoring solution and dataset available.

Protecting your customers is all about getting actionable data in a timely manner. If your offering isn't powered by the right data, all of the data, and data in a format your product can quickly consume, you're at a clear competitive disadvantage in the market.

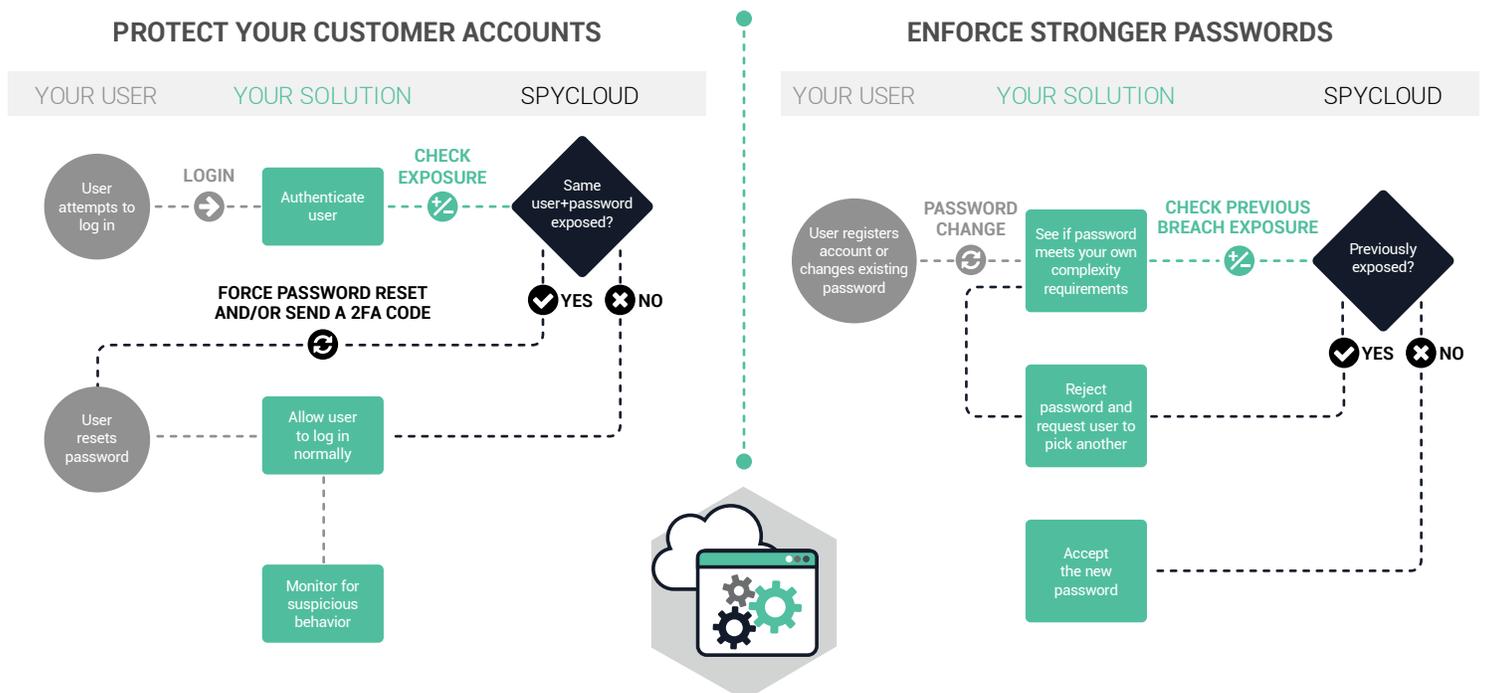

SpyCloud utilizes human intelligence (HUMINT) and automated scanning to gain access to the same data the fraudsters use. Through our proprietary technology and tradecraft, we can share exposed data with our partners before it is used to cause harm,

typically weeks or even months before it becomes available to "dark web scanners."

Stolen credentials and account takeover are problems that are growing at an alarming speed. According to the 2017 Verizon Data Breach Report, 81 percent of hacking-related breaches leveraged either stolen and/weak passwords. The National Institute of Standards and Technology (NIST) has taken notice, recently setting forth requirements for federal systems to check passwords against exposed credentials and encouraging nongovernmental organizations to follow suit.

The earlier 3rd party breaches are discovered, the faster you can mitigate the risk and prevent collateral damage - but it all depends on the quality and quantity of data you have at your fingertips.

Bring Better Products to Market Faster with the **SpyCloud API**

SpyCloud API for Product Development

SpyCloud API and S3 Bucket

We start with millions of raw breached assets recovered daily, then distill and transform them into high-quality, well-formatted and deduplicated data that is ingested into our database. Using the SpyCloud API or S3 bucket, product developers have immediate access to our easy-to-read, historical, and real-time dataset to quickly develop products that consume our data. Your database is updated within 24 hours so it is always current, always reliable.

SpyCloud API Documentation

Good API documentation is a product developer's best friend. Our documentation enables developers to bring products to market faster, with no extra coding or steps to slow them down. Our API documentation is remarkably easy to use and test, and is secure and stable. With our meticulous instructions and feature explanations, product developers can begin using our API in minutes.

The SpyCloud Difference

✔ Human Intelligence and Rock-Solid Data

SpyCloud offers the most comprehensive, cleansed data available to make your product effective at mitigating the harm that can be caused by exposed credentials and empowering your customer to take immediate action if a breach is discovered. We get access to the most sources and to data people don't know exists. Many other companies use only automated means of obtaining breach data from public forums and fail to cleanse it so that it is accurate and usable.

✔ Access to Decrypted Plaintext Passwords

SpyCloud manages the most expansive database of decrypted plaintext passwords in the industry. Once a new breach is recovered from the dark web, we use specialized hardware and software to decrypt as many of the encrypted password hashes as possible. With over 8 billion passwords

recovered today, more than 6 billion of them are in plaintext format, giving you the ability to prove user exposures and automate password exposure checks across internal systems.

✔ Largest Database, Most Matches and Most Industry-Leading Partners

Because of our proprietary use of both HUMINT and automation tools, SpyCloud boasts the largest database and the highest match rate of accounts being sold on the black market. No wonder we were winners of the 2017 NATO Defense Innovation Challenge and the 2017 Finovate Best of Show, and runner-up at the Educause Startup Pitch Competition. It's also one of the reasons leading companies such as Cisco, Avast and Alien Vault rely on SpyCloud to protect their employee and customer accounts.

45 BILLION ASSETS, & COUNTING

10.5 BILLION EMAILS

9.5 BILLION PASSWORDS

50 MILLION NEW DATA ASSETS RECOVERED EVERY WEEK

4X NEARLY 4X THE MATCHES OF THE INDUSTRY AVERAGE

Develop your products with the best data possible.
